Sequence-specific recombination of DNA in eukaryotes, useful particularly for somatic cell gene therapy, uses an integrase to effect recombination between att sites.

Claim 3; Page 14; 24pp; German.

This invention describes a novel sequence-specific recombination (SSR) of DNA in a eukaryotic cell, comprising introducing two DNA sequences (I, II) into a cell, using an integrase (Int) to effect SSR. The invention also describes (1) a nucleic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) vector containing (III), or its derivatives, plus a therapeutic gene, or its derivatives. The method is particularly used in somatic gene therapy in humans and animals, but can be applied more generally for gene transfer to animal or plant cells. The method is simple and controllable, and provides stable and targeted integration of selected DNA sequences

Rat cryptdin-1, -2, and -3 genes (see also T30736 and T30738) were isolated from a Sprague-Dawley genomic library cloned in EMBL3. The cryptdin-2 gene, or corresponding cDNA (see also T30734), can be used to produce large amounts of cryptdin-2 for use in treating inflammatory pathologies of the intestine

The invention relates to a promoter (A) that is: (i) any of the sequences ABN81281-ABN81284; (ii) the complement of (i); or (iii) a sequence that hybridises to (ii). (A) are used, specifically in Beta vulgaris, to control expression of transgenes, particularly to alter carbohydrate metabolism; reduce loss of storage substances; express invertage inhibitor, fructosyl transferase, levan sucrase or genes that encode transporter proteins for nitrogen compounds, or increase resistance to, or tolerance of, pathogens. (A) provide tissue-specific transgene expression, either in roots or above-ground parts, so avoid pleiotropic effects, e.g. when expressing invertage inhibitor
                                                                                                                                                                                                             New tissue-specific promoters from Beta vulgaris, useful e.g. for altering carbohydrate metabolism, express transgenes selectively in roots
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 3049 BP; 783 A; 699 C; 876 G; 691 T; 0 U; 0 Other;

This DNA fragment obtainable from Arabidopsis thaliana is capable of promoting rook knot and cyst nematode-inducible transcription of an promoteries associated DNA sequence when reintroduced into a plant. The promoteriess GUS construct binary vector pWGG553 was mobilised by triparental mating to Agrobacterium tumefaciens MGG101 and the resulting strain was used for Arabidopsis root transformation. Line pMGG553455 was identified as a line which showed strong GUS expression inside syncytia and giant cells induced by the cyst nematode Heterodera schachtii and the root knot commenced Meloidogyne incognita, respectively. Promoter tags from line pMG553425 were sequenced. The claimed DNA fragment is nematode feeding site-specific. Also claimed are: (1) a portion or variant of the above creapable of promoting root knot and cyst nematode inducible transcription of an associated DNA sequence when reintroduced into a control, and which causes the production of a plant cell-disruptional control, and which causes the production of a plant cell-disruptional control, and which causes the production of a plant cell-disruption control, and which causes the production of a plant cell-disruption control, and which causes the production of a plant cell-disruption control, and which causes the production of a plant cell-disruption control, and which causes the production of a plant cell-disruption control, and which causes the production control cell-disruption control control, and which causes the production control cell-disruption control control control control control control control control control cell-disruption control cell-disruption control cell-disruption control cell-disruption control cell-disruption control cell-disruption cell-disruption control cell-disruption control cell-disruption cell-disruption cell-disruption cell-disruption cell-disruption cell-disruption cell-disruption cell-disruption cell-disruption cell-disruption cell-disruption cell-disruption cell-disruption cell-disruption cell-disruption cell-disrupt

a plant cell having incorporated into its genome the chimeric DNA of (2); (6) a root system of a plant consisting of the cells of (5); (7) a plant consisting of the cells of (5); (7) a plant especially a potato plant; (8) a plant grafted onto the root system of (6); (9) a part of a plant, selected from seeds, flowers, tubers, roots, leaves, fruits, pollen and wood, obtained from the plant of (7) or (8), and (10) a crop consisting of the plants of (7) or (8). The DNA fragment can be used to identify subfragments capable of promoting transcription of an associated DNA sequence in a plant. It can also be used for making hybrid regulatory DNA sequences. The chimeric DNA sequence of (2) can be used for transforming plants (all claimed). The DNA sequence can be used to reduce the susceptibility of a plant to parasitic nematodes. (Updated on 17-OCT-2003 to standardise OS field)

6). The invention provides sequences shown in AAW63160 to AAW65169 that are inhibitors of mMCP-6. These peptides which are tryptase-6 complex inhibitors, can be used for treating a mast cell-mediated inflammatory disorder. The inhibitors can be used to treat inflammatory disorders including asthma, allergic rhinitis, uriticaria and anticedema, eczematous dermattis; (atopic dermattis), hyperproliferative skin disease, anaphylaxis, peptic ulcers, inflammatory bowel disorder, hyperresponsiveness and inflammatory skin conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             374 CIGCITITITATACTAAGTIGGCATTATAAAAAGCATIGCTITATCAATTIGTIGCAACG 433

The invention provides: compositions comprising an isolated tryptase-7 (such as mMCP-7, see AAW64233); a method for treating a blood clot by administering a nucleic acid molecule that codes for a tryptase-7, or an expression product; a nucleic acid encoding a serine procease (SP); and a method of producing a mature SP. Tryptase-7 polypeptides can be used for treating disorders mediated by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        undesirable thrombus clot formation such as myocardial infarction and reocclusion following angioplasty of blood clots associated with pulmonary thromboembolism, deep vein thrombosis, cerebral embolism, renal

The DNA sequence encoding the improved barstar, leads to increased barstar production in tapetum cells, due to improved translation, and possibly protein stability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 CTGCTTTTTTATACTAAGTTGGCATTATAAAAAGCATTGCTTATCAATTTGTTGCAACG 60

DNA in a enkaryotic cell, comprising introducing two DNA sequences (I, into a cell, using an integrase (Int) to effect SSR. The invention also describes (1) a nucleic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) vector containing (III), or its derivatives, plus a therapeutic gene, or its derivatives. The method is particularly used in somatic gene therapy in humans and animals, but can be applied more generally for gene transfer to animal or plant cells. The method is simple and controllable, and provides stable and targeted integration of selected DNA sequences
                                                                            Sequence-specific recombination of DNA in eukaryotes, useful particulariy for somatic cell gene therapy, uses an integrase to effect recombination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CAGCITITITIATACTAAGTIGGCATTATAAAAAAGCATIGCITATCAATTIGTIGCAACG 201
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Site-specific integration of DNA into plastid DNA, useful for making transgenic plants used e.g. as food, by recombinase-mediated insertion.
                                                                                                                                                                                                        This invention describes a novel sequence-specific recombination (SSR)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 CTGCTTTTTTATACTAAGTTGGCATTATAAAAAAGCATTGCTTATCAATTTGTTGCAACG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequences given in AAQ50309-26 are probes which were used on a chip for capturing a number of target polynucleotides. A group of these probes may be attached on cells which form part of a single chip. The oligonucleotides to be detected are labelled and are complementary to the set of capture probes used. The detection chip may be used to detect a number of different polynucleotides concurrently
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CAGCTTTTTTATACTAAGTTGGCATTATAAAAAGCATTGCTTATCAATTTGTTGCAACG 102

derived cells. Transgenic plants in which a DNA sequence has been integrated, also their cell cultures, organs, tissues etc. are useful in human or animal nutrition, to produce seeds, and to produce pharmaceuticals or fine chemicals, e.g. erzymes, vitamins, amino acids, flavourings and aromatizing agents, dyes, antibodies and vaccines. The present sequence is a recognition sequence shown in the exemplification
                                                                                                                                                                                    09

The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial chromosomes, methods for delivery of plant chromosomes to selected cells and tissues. The isolated plant artificial chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous nucleic acid encoding a gene product such as enzymes, antisense RNA, tRNA, trNA, structural proteins, marker proteins, ligands, receptors, ribozymes, therapeutic proteins, and

This is useful in the production of transgenic plants with less risk of inter-species transmission of marker genes, which often encode proteins associated with, for example, herbicide and antibiotic resistance. The present sequence is the attP coding region
                                                                                                                                                                                                                                                                                                                                   09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Removing a part of a transgene which has been integrated into a genome comprises inducing intrachromosomal homologous recombination between the attachment P regions of bacteriophage lambda flanking the transgene.
biopharmaceutical proteins, vaccines, blood factors, antigens, hormones, cytokines, growth factors, antibodies, or a product that provides for resistance to diseases, insects, herbicides, or stress in a plant. The heterologous nucleic acid optionally encodes a product that provides an agronomically important trail in the plant, e.g. a product that alters nutrient use and/or improves the nutrient quality of the plant. The heterologous nucleic acid is contained within a bacterial artificial chromosome (BAC) or a yeast artificial chromosome (BAC). This polynucleotide sequence represents an oligo relating to the method for producing plant artificial chromosomes of the invention

The sequences given in ABQ80304-05 are primers which were used to amplify DNA for use in the material of the invention. The primers amplify a 1377 bp portion of lambda phage DNA contained in a plasmid. The amplified comprises at least one support having at least one oligomer and/or collymer applied on it. The printed material is useful in a method for synthesising DNA where the product of amplification and/or ligation is contained to the insertion/deletion, single nucleotide insertion/deletion, single nucleotide contained in a method for containation of nucleotide insertion/deletion, or SNP analysis.

CC determination of protein expression. The printed material is useful in cresearch applications, or from the printed materials seasily and immediately. From the copymers from the printed materials analyor polymer can be obtained immediately and directly, without need to make a request for it. The climpant and time while eliminating the need to make a request for it. The labour and time while eliminating the need to use special equipment or familities mhis while eliminating the need to use special equipment or familities mhis the printed material is a mick, efficient and

This invention describes a novel sequence-specific recombination (SSR) of DNA in a enkaryotic cell, comprising introducing two DNA sequences (I, II) into a cell, using an integrase (Int) to effect SSR. The invention also describes (1) a nucleic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) vector containing (III), or its derivatives, plus a therapeutic gene, or its derivatives. The method is particularly used in somatic gene therapy in humans and animals, but can be applied more generally for gene transfer to animal or plant cells. The method is simple and controllable, and provides stable and targeted integration of selected DNA sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence-specific recombination of DNA in eukaryotes, useful particularly for somatic cell gene therapy, uses an integrase to effect recombination between att sites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel sequence-specific recombination (SSR) of DNA in a eukaryotic cell, comprising introducing two DNA sequences (I. II) into a cell, using an integrase (int) to effect SSR. The invention also describes (1) a nucleic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) ector containing (III), or its derivatives, plus a therapeutic gene, or its derivatives. The method is particularly used in sommatic gene therapy its derivatives. The method is applied more generally for gene theraps transfer to animals, but can be applied more generally for gene transfer to animal or plant cells. The method is simple and controllable, and provides stable and targeted integration of selected DNA sequences
                                                                                                                                                                                                                                                                                                                                Sequence-specific recombination; SSR; integrase; gene therapy; somatic; targeted integration; attP; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method for the site-specific integration of a DNA sequence into the plastid DNA of a plant or its derived cells. Transgenic plants in which a DNA sequence has been integrated, also their cell cultures, organs, tissues etc. are useful in human or animal nutrition, to produce seeds, and to produce pharmaceuticals or fine chemicals, e.g. enzymes, vitamins, amino acids, flavourings and aromatizing agents, dyes, antibodies and vaccines. The present sequence is a recognition sequence shown in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TITIACAGIATIAIGIAGICIGITITITIAIGCAAAAICIAAITITAAIATATIGAIATITA 125

cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for making a library of ACes comprising random portions of a genome. ACC44612 to ACC44732 and ABP96650 to ABP96657 represent sequences used in the
                                                                                                                                                                                                                                                                                                     Chromosome-based platform, artificial chromosome, eukaryotic chromosome, att site, integrase, recombinase, ACes, gene therapy, transgenic animal, platform artificial chromosome expression system, gene, ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           one or several att sites, where an att site is heterologous to the chromosome, and permits site-directed integration in the presence of lambda-integrase. Also described: (1) a platform artificial chromosome expression system (ACes) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (M1) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (M1) is useful for introducing a heterologous nucleic acid molecule into a platform artificial chromosome, preferably an ACes. (II) is useful for producing artificial cannow preferably an ACes. (II) is useful for producing transgenic animal (e.g. a fish, insect, reptile, amphibian, arachind, or mammal) by introducing (II) by cell fusion, lipid-mediated transfection by a carrier system, microinjection, microcell fusion, electroporation, and professibly a stem cell or an ambryonic coll continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a eukaryotic chromosome (I) comprising

The invention relates to a novel method for producing plant artificial chromosomes. The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial chromosomes, methods for delivery of plant chromosomes to selected cells and tissues. The isolated plant artificial chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC comprises a heterologous nucleic acid encoding a plant cell. The PAC comprises a heterologous nucleic acid encoding a gene product such as enzymes, antisense RNA, ERNA, EDNA, structural proteins, marker proteins, lagands, receptors, ribozymes, therapeutic proteins, and biopharmaccutical proteins, vaccines, blood factors, antigens, hormones, cytokines, growth factors, antibodies, or a product that provides for resistence to diseases, insects, herbicides, or stress in a plant. The heterologous nucleic acid optionally encodes a product that alters nutrient use and/or improves the nutrient quality of the plant. The heterologous nucleic acid optionally encodes a product that alters nutrient use and/or improves the nutrient quality of the plant. The heterologous nucleic acid is contained within a bacterial artificial chromosome (BAC) or a yeast artificial chromosome (MAC). This polyanic acid is contained within a bacterial artificial chromosome (BAC) or a yeast artificial chromosome (MAC). This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Producing artificial chromosome by introducing a nucleic acid into plant cell, selecting artificial chromosome that has one or more repeat regions with equivalent amounts of euchromatic and heterochromatic nucleic acids.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method of removing a transgene marker by flanking the transgene with a bacteriophage lambda attachment P (attP) region and inducing homologous recombination between attP regions so that the transgene is removed. This is useful in the production of transgenic plants with less risk of inter-species transmission of marker genes, which often encode proteins associated with, for example, herbicide and antibiotic resistance. The present sequence is the attP coding region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              198

The sequences given in ABQ80304-05 are primers which were used to amplify DNA for use in the material of the invention. The primers amplify a 1377 bp portion of lambda phage DNA contained in a plasmid. The amplified sequence (ABQ80306) was attached to the printer material of the invention which comprises at least one support having at least one oligomer and/or colline applied on it. The printed material is useful in a method for synthesising DNA where the product of amplification and/or ligation is conversed and used for synthesising DNA where the product of amplification and/or ligation is collymorphism (SNP) and sequencing analysis, in a diagnostic method for determination of nucleotide insertion/deletion, or SNP analysis.

CC optionally, the cDNA and/or full-length cDNA is useful for the peptide, polymetrial expression. The printed material is useful in research applications, or for providing scientists with oligomer and/or polymetrs can an oligomer and/or polymetr can be obtained immediately and directly, without meed to make a request for it. The cligomers and/or polymers can be delivered and stored easily with reduced labour and time while eliminating the need to use special equipment or facilities. Thus, the printed material is a quick, efficient and inexpensive sample delivery system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   867
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       868 TITITACAGIATIAIGIAGICIGITITITIAIGCAAAAICIAAITITAAIATITGAIAITIA 927

This sequence represents rat neuronal immediate early gene (IEG) cDNA clone R280. An IEG is a gene whose expression is rapidly increased immediately following a stimulus e.g., neuronal stimulation. Such neuronal IEGs have been found to encode as variety of proteins, including transcription factors, cytoskeletal proteins, growth factors and metabolic enzymes, as well as proteins involved in signal transduction. The identification of neuronal IEGs and the proteins they encode may provide important information about the function of neurons in, for example, learning memory, synaptic transmission, tolerance and neuronal pasticity. Neuronal IEGs, neuronal IEG protein products, cells cxpressing neuronal IEGs and antibodies against neuronal IEG proteins can be used to treat an animal with a deficiency in neuronal IEG responsivity to stimuli, such that the effect of the deficiency is minimised. The channel are an animal with a movement of expression of an IEG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel genes and polypeptides, useful for treating conditions related to a deficiency in nIEG responsiveness to a stimulus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       431 renginacaggicaeraanacearciaagiagingaricaragigacigearargrierg 372

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method for storing and/or delivering an oligomer and/or polymer applied on support. The support has oligomer and/or polymer applied on it, and is in the form of loose-leaf sheet or a card. The support is useful for storing and/or delivering an oligomer and/or polymer applied on it. The present sequence is Bacteriophage lambda DNA used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120
